CBEFS: Chesapeake Bay Environmental Forecast System

Atmospheric inputs

- Estuarine model**
ChesROMS-ECB
- 600m x 600m grid
 - 20 depth levels
 - Tides, circulation
 - Nutrients, plankton
O₂, pH, sediment

- Reanalysis Products
- Winds
 - Solar radiation
 - Temperature
 - Precipitation

Terrestrial inputs

USGS gauge data;
Phase 6+real-time
discharge+AI model

Coastal inputs

In situ data, NOAA
climatology &
coastal ROMS model

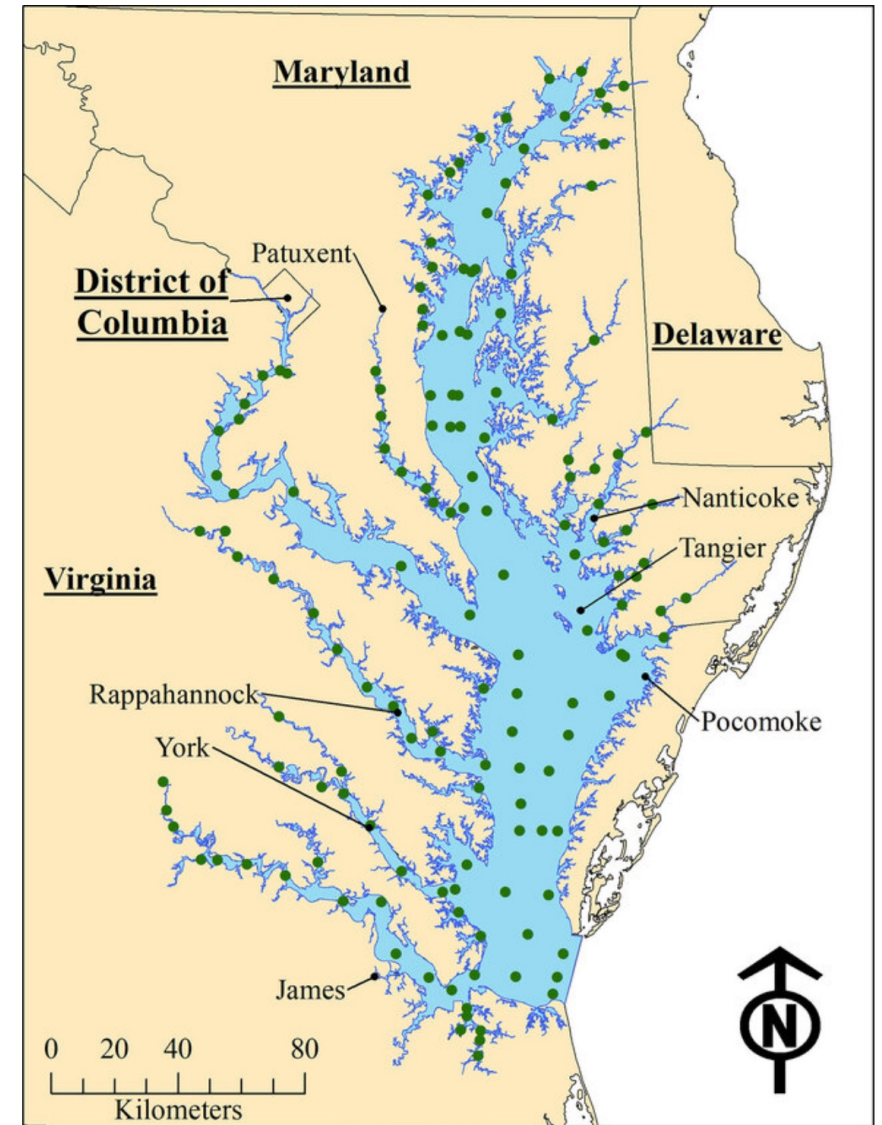

Bever et al., *Env Model. & Software*, 2021

Data are critical for model development!

**Evaluated and CBP WQ Monitoring data
(~37 yrs of data; ~17 cruises/yr)**

- Temperature
- Salinity
- Oxygen
- pH
- Nutrients
- Chlorophyll

→ And now, continuous vertical profile data!

Chesapeake Bay Environmental Forecast System

Use our forecasts and "nowcasts" of temperature, salinity, dissolved oxygen, and other physical and chemical factors within the Chesapeake Bay to help monitor Bay health and plan your on-the-water activities. Based on observations and **computer models** developed by the Virginia Institute of Marine Science and partners, these tools accurately predict the current status of important environmental variables and how they are likely to change in the short-term.

Our Chesapeake Bay Environmental Forecast System simulates 3 conditions for each selected variable:

1. **Nowcast:** present-day status of selected variable in Chesapeake Bay
2. **2-Day Forecast:** status of selected variable in the Bay 2 days from now, and
3. **Forecast Trend:** difference between nowcast and forecast (% change over 2 days)

Click a selection below to access the specified simulation.

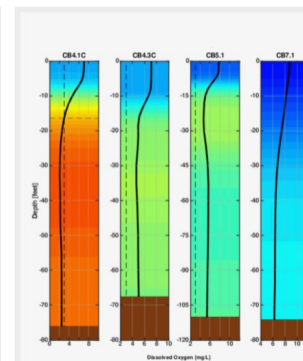

DISSOLVED OXYGEN (DO)

Discover when and where low-oxygen "dead zone" conditions may form.

DEAD ZONE SIZE

Track "hypoxia" in the Bay, as measured by the volume of waters where DO levels are below 2 mg/L.

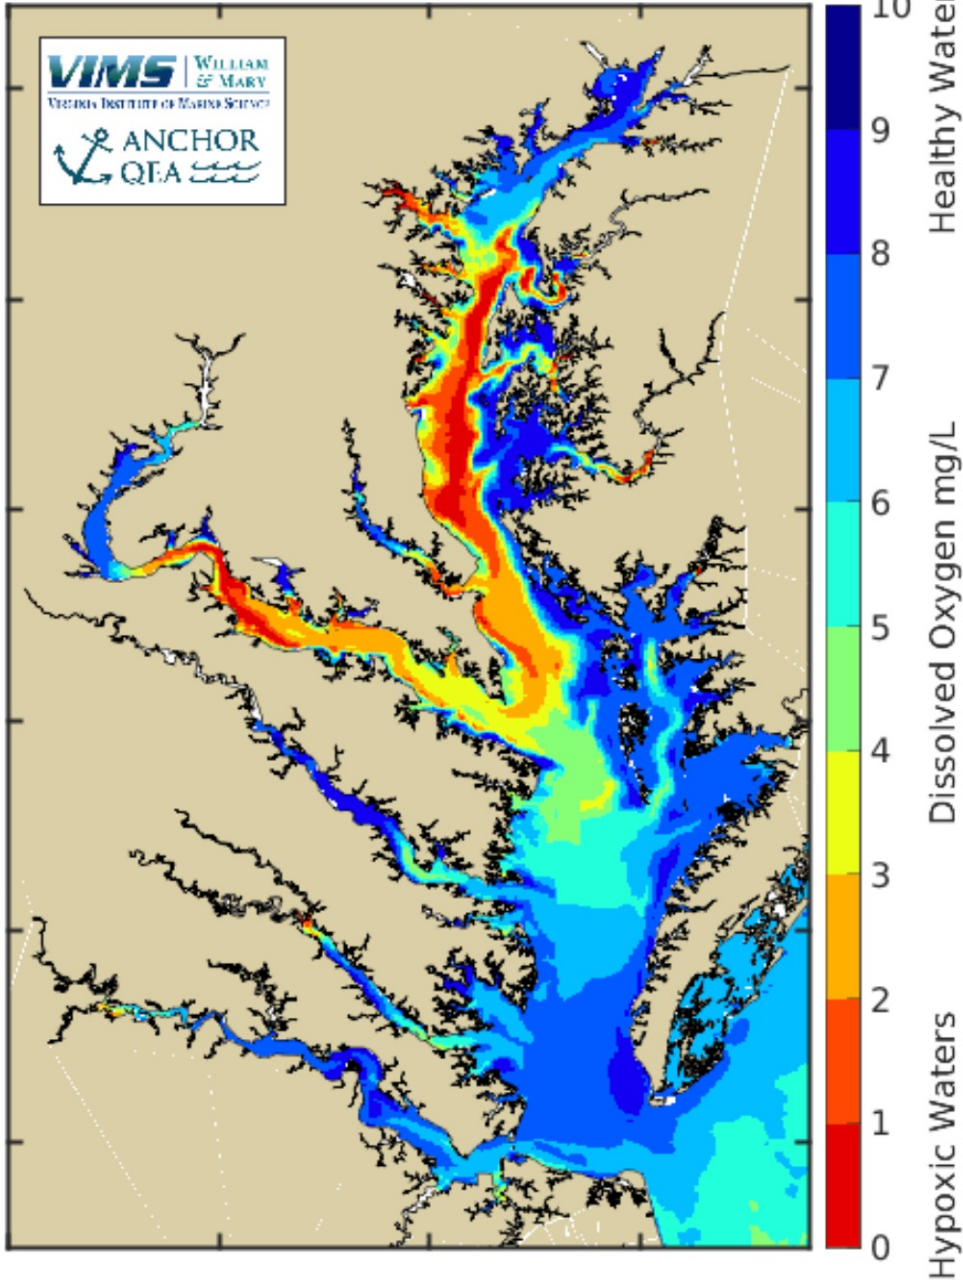

DEPTH TO LOW OXYGEN

Find the depth to fish-unfriendly waters where dissolved oxygen levels fall below 3 mg/L.

- Temperature
- Salinity
- Hypoxia/Dead Zone size
- Acidification metrics
- Bacteria (Vibrio)
- Harmful Algal Blooms (HABs)

Bottom Oxygen: Forecast June 15, 2023

snapshot of
forecast for today

Blues → High bottom oxygen

= Good bottom water

= Bottom fish and crabs

Yellow/green → Moderately low oxygen

= Poor bottom water

= Fewer bottom fish and crabs

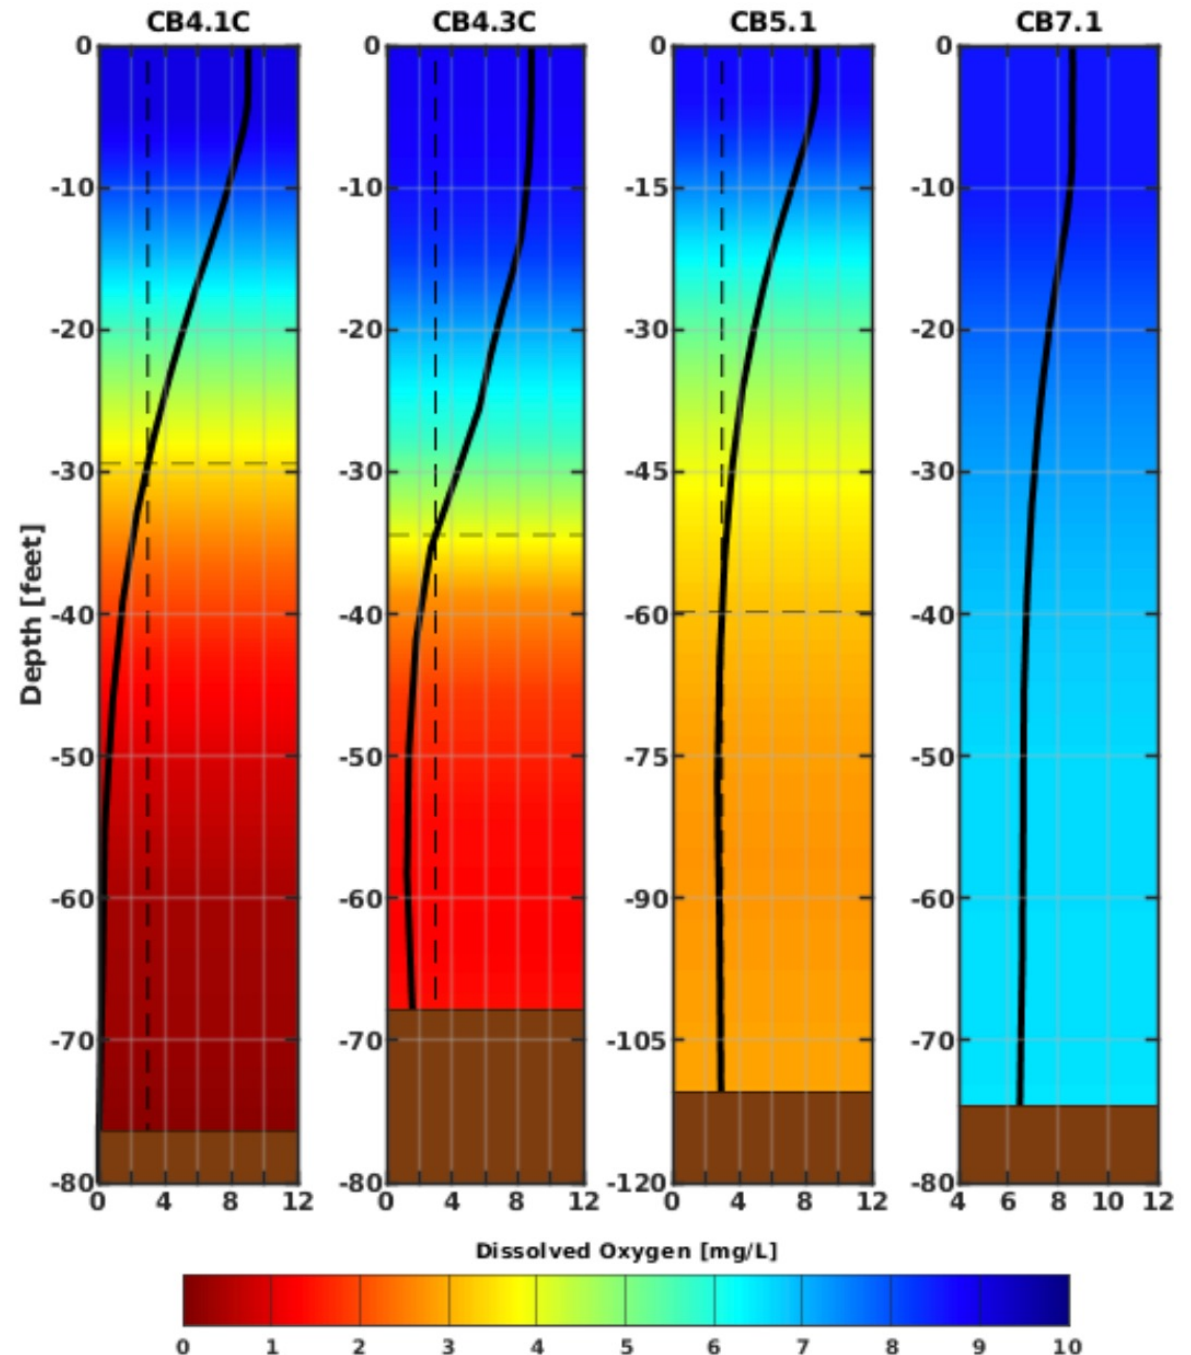

Red → Very low bottom oxygen

= Bad bottom water

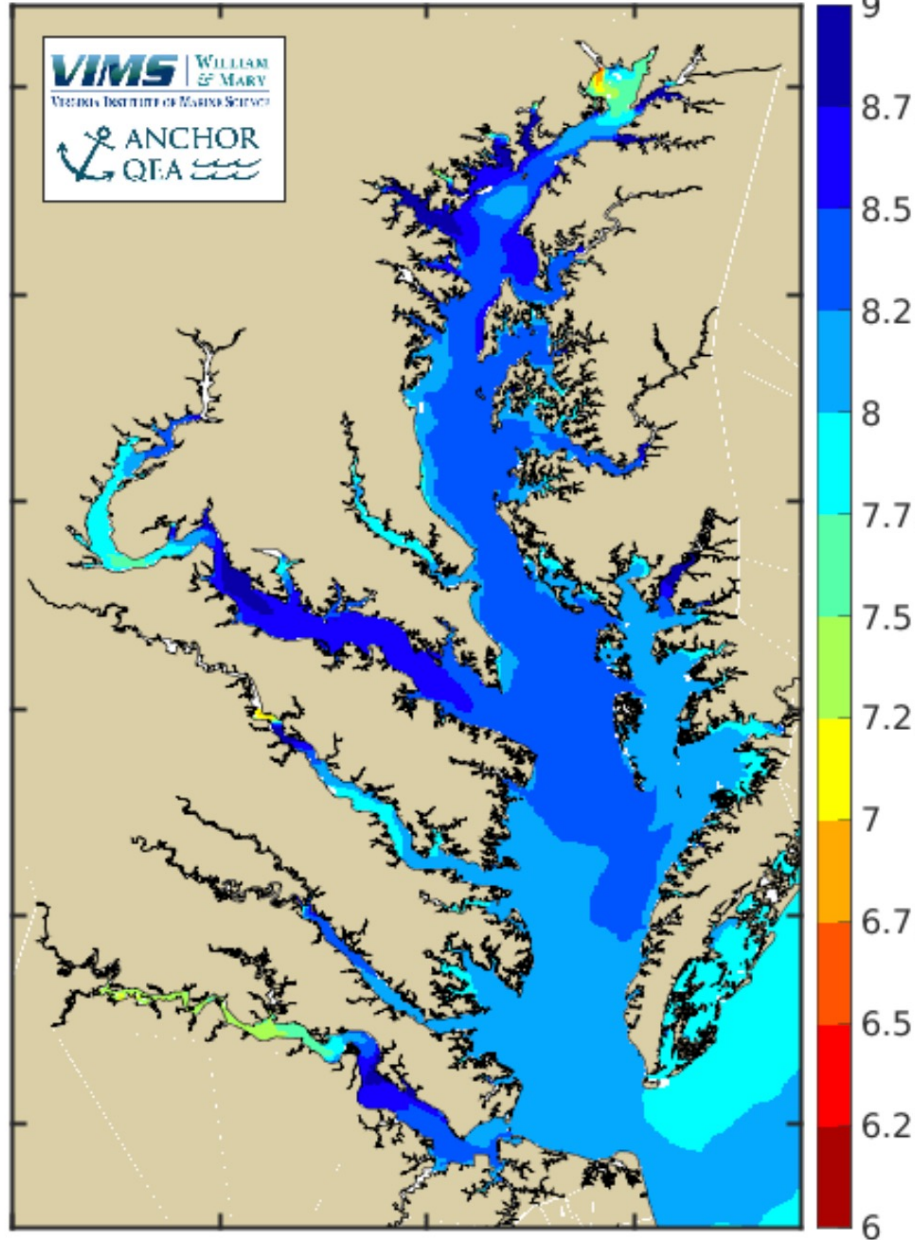

= No bottom fish or crabs

Depth to 3 mg/L: Nowcast June 13, 2023

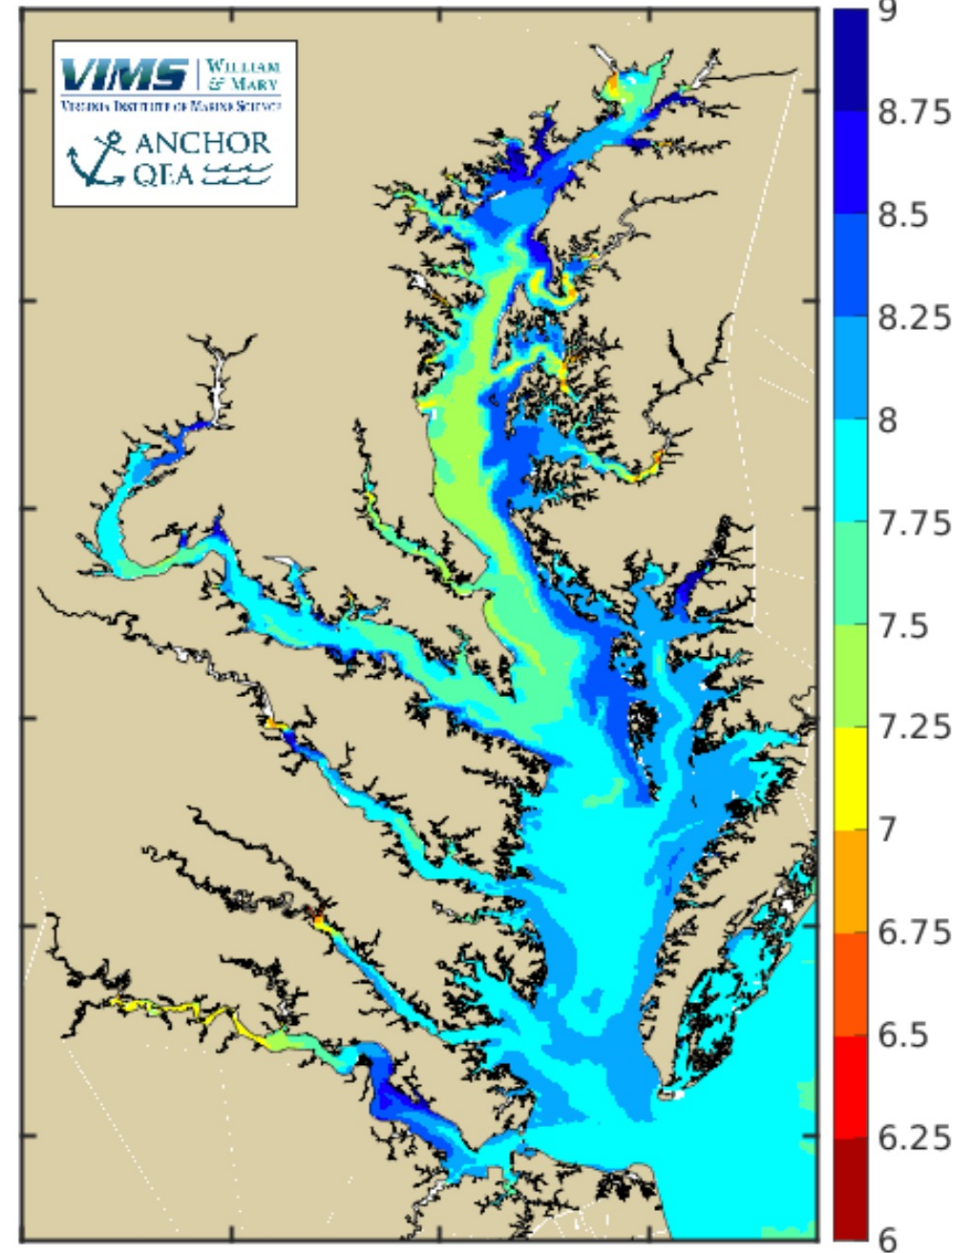

Nowcast: June 13, 2023

**Surface pH: Forecast

VIMS 2022 Dead Zone Report Card

2022 Chesapeake Bay Dead Zone Report November 2022

Hypoxia Background

The “Dead Zone” of the Chesapeake Bay refers to a volume of deep water that is characterized by oxygen concentrations less than 2 mg/L, which is too low for aquatic organisms such as fish and blue crabs to thrive. The Chesapeake Bay experiences such “hypoxic” conditions every year, with the severity varying from year to year, depending on nutrient and freshwater inputs, wind, and temperature. Multiple metrics are used to relate the severity of hypoxia between different years:

- **Maximum Daily Hypoxic Volume** (km³): The greatest volume of Chesapeake Bay water experiencing hypoxic conditions on any day of the year¹
- **Duration of Hypoxia** (days): The number of days in a given year between the first and last day of hypoxic conditions exceeding 2 km³ in volume
- **Total Annual Hypoxic Volume** (km³ days): The total amount of hypoxia in the Bay for a given year, calculated by summing the hypoxic volume on each day

VIMS 2022 Dead Zone Report Card

2022 Chesapeake Bay Dead Zone Report November 2022

Hypoxia Background

The “Dead Zone” of the Chesapeake Bay refers to a volume of deep water that is characterized by oxygen concentrations less than 2 mg/L, which is too low for aquatic organisms such as fish and blue crabs to thrive. The Chesapeake Bay experiences such “hypoxic” conditions every year, with the severity varying from year to year, depending on nutrient and freshwater inputs, wind, and temperature. Multiple metrics are used to relate the severity of hypoxia between different years:

In 2022:

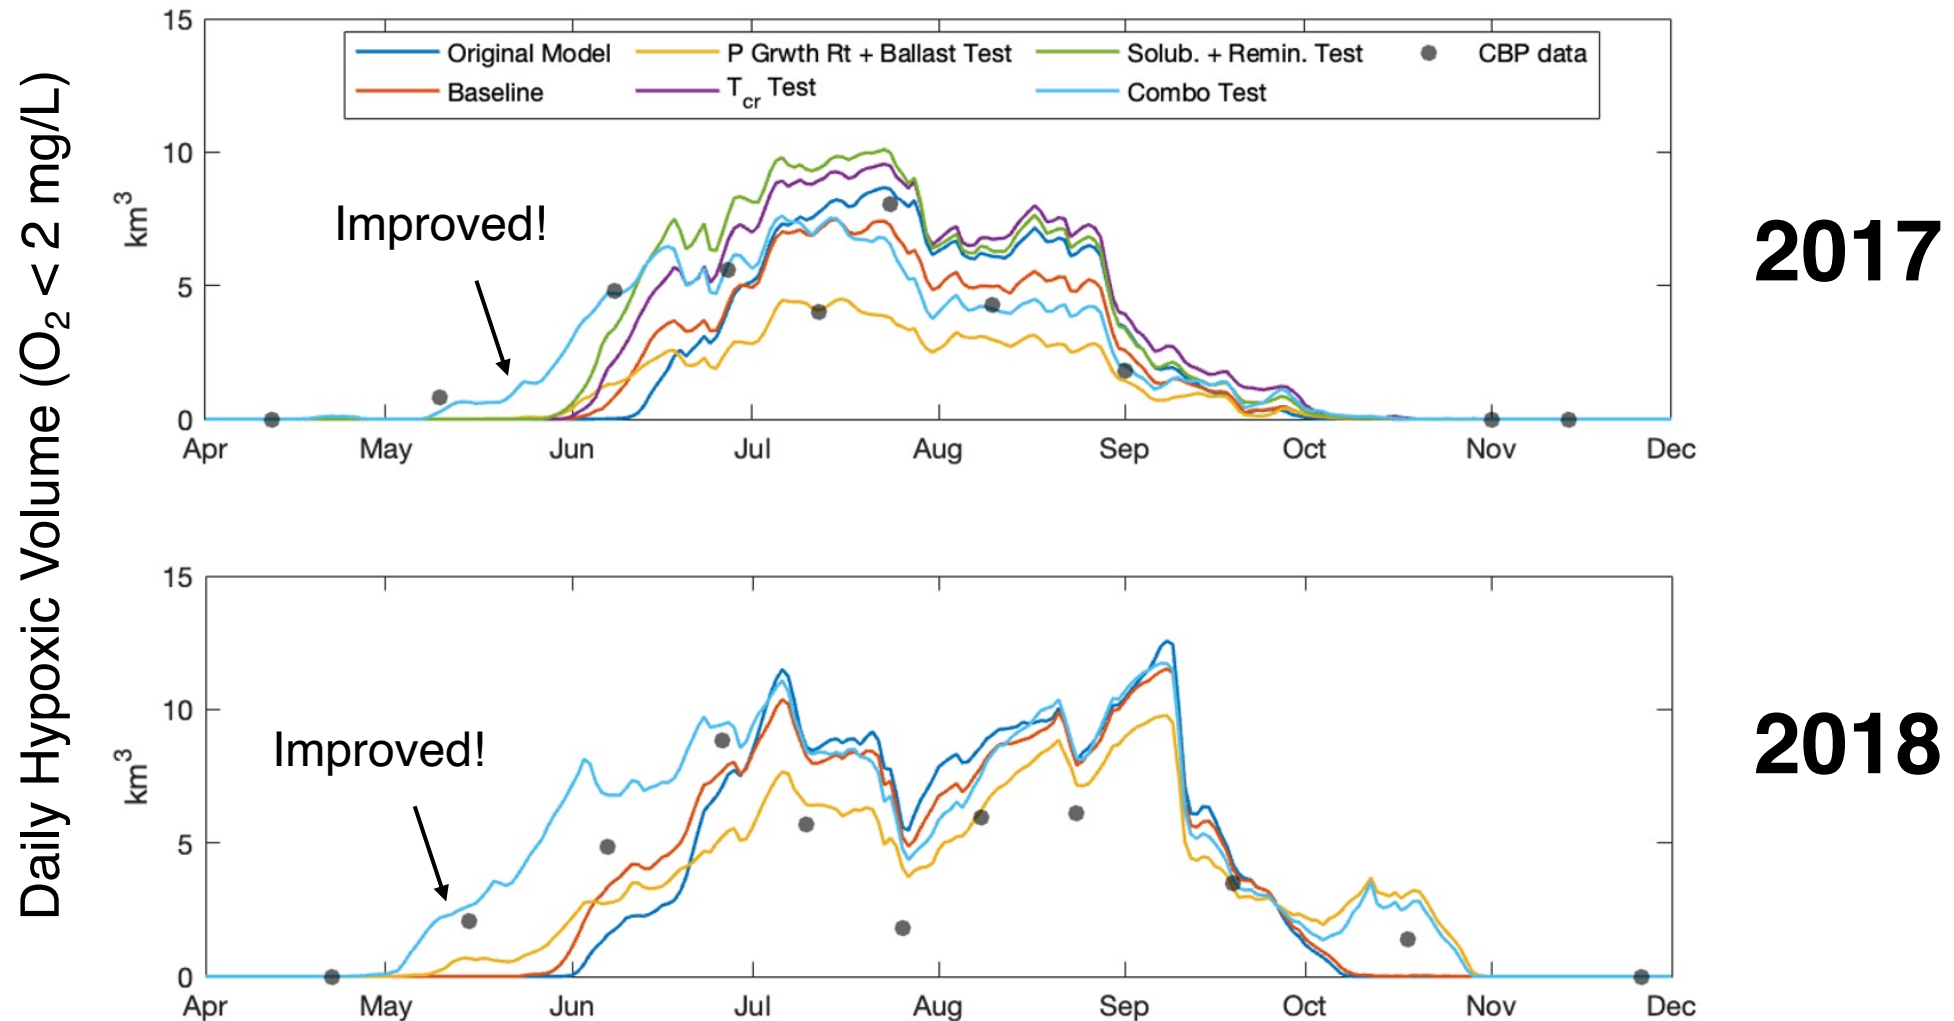

- **Maximum daily hypoxic volume was near average, less than 54% of historical years**
- **Duration of hypoxia was less than most (95% of) historical years**
- **Total annual hypoxic volume was less than many (76% of) historical years**

Summary

- CBEFS provides short-term forecasts of multiple products (hypoxia, acidification, HABs)
 - Large and increasing set of end-users
 - Also used for long-term climate change and nutrient reduction scenarios (Irby et al., 2018, St-Laurent et al., 2019; Frankel et al., 2022, Hinson, et al., 2022, 2023...)
- Access to in situ data are critical:
 - Model development
 - Model improvement
 - Model evaluation
 - Increasing confidence of end-users
- Real-time vertical profiling data will be extremely useful in all these ways!
