P7 Watershed Model Planning

Gary Shenk – CBPO

Modeling Workgroup

1/4/2021

Input from various groups

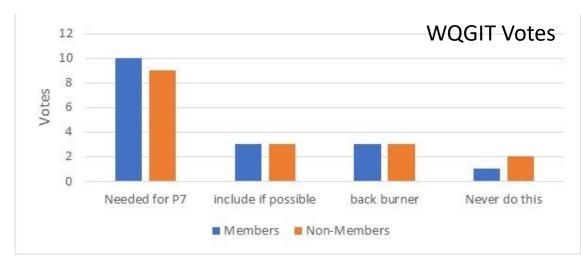

- WQGIT
 - October 2021 meeting, voting and comments
 - Phase 6 review 2016
- Other GITs November/December 2021
- STAC
 - P6 review (2017)
 - Modeling beyond 2025 workshop (2019)
- Other partners for hydrology October 2019
- Modeling Workgroup ongoing

WQGIT

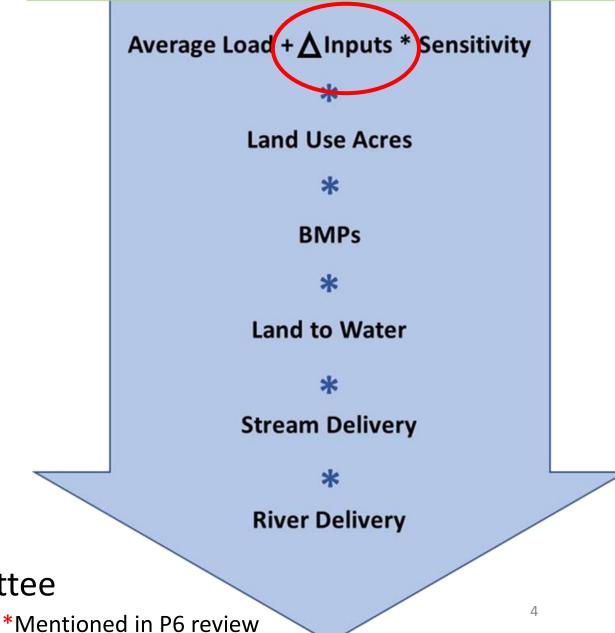

Potential Areas of Focus	Recommend- ations	lmpacts Estuarine Model	Impacts CAST	Level of effort	Benefits
Finer-scale modeling	WQGIT, other GITs, STAC	✓	✓	High	Greater accuracy watershed modeling; Enables fine scale targeting of practices; Needed for some co-benefits
Spatially explicit CAST	Non-CB TMDL partners		√	Medium	Enables CAST output on a fine scale
Physical process simulation	STAC, WQGIT other GITs, CBPO	✓	\checkmark	Low-High	Greater watershed model accuracy overall
Nutrient Application calculation	СВРО		✓	Medium- High	Increases transparency of CAST scenarios; Reduces unintended consequences of model and data changes
Land use change 1985-2035	CBPO, WQGIT	✓	✓	High	Greater accuracy of land use changes through time. Allows direct use of fine-scale land use data in CAST
Improve climate change modeling	PSC, WQGIT	✓	✓	Low	Directly addresses PSC priorities; improves confidence in 2025 climate decision.
Uncertainty Quantification	WQGIT, STAC			Medium	Helps prioritize model updates; Incorporates trends in monitored data
Co-benefits and ecosystem services	WQGIT, other GITs, STAC		✓	Low-High	Helps partners develop comprehensive plans that benefit local citizens.
WQ standards Assessment	WQGIT, STAC			Low- Medium	Potential to assess all tidal oxygen standards and to delist segments

Nutrient Application

- Animal Counts / Manure *
- Fertilizer *
- Fixation
- Soil P*
- Urban fertilizer
- Need Agricultural Modeling Subcommittee

Improve Climate Modeling

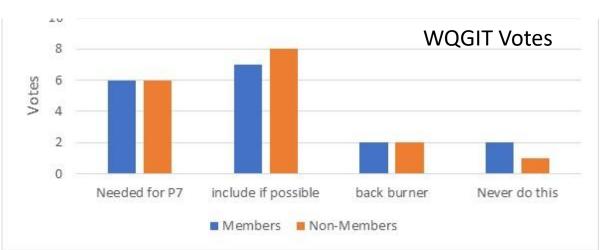

- Very few comments
- Recognition that we needed to make a 2035 assessment
- Climate effects are a scenario that we run after development

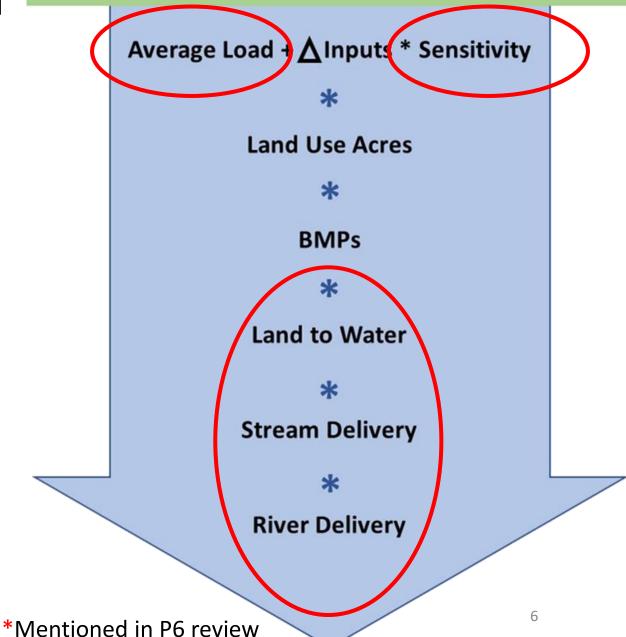

Phase 6 Model Structure Average Load + AInputs Sensitivity Land Use Acres **BMPs** Land to Water **Stream Delivery**

River Delivery

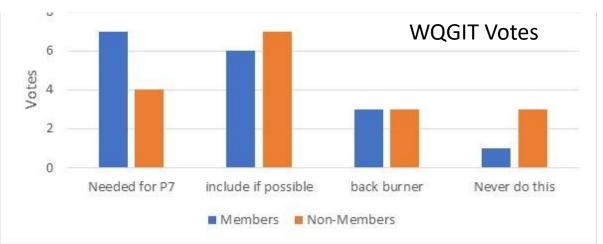

Physical Process Simulation

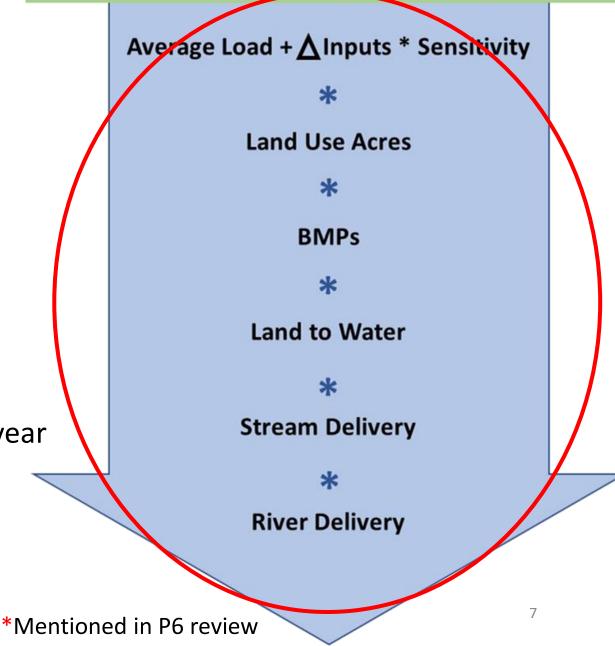

- Average loads by land use *
 - Will require significant workgroup effort
- Sensitivities *
- Urban P *
- Groundwater
- Delivery *
- Speciation

Uncertainty Quantification

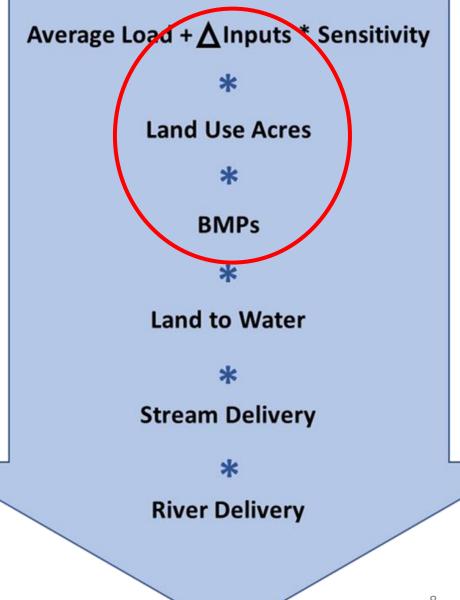

- Inverse quantification *
 - Uncertainty of predicted change in load
 - Compare to observed trends
 - Isabella has been presenting for the past year
- Forward Propagation *
 - Estimate uncertainty of all inputs
 - Identify most important inputs
 - Takes a lot of work from the partnership

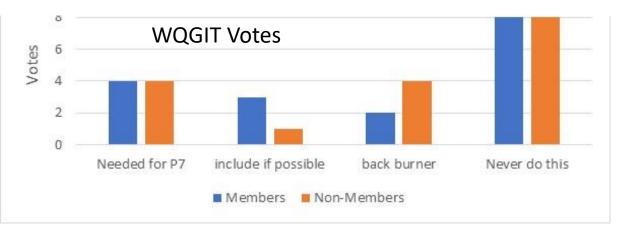

Co-Benefits

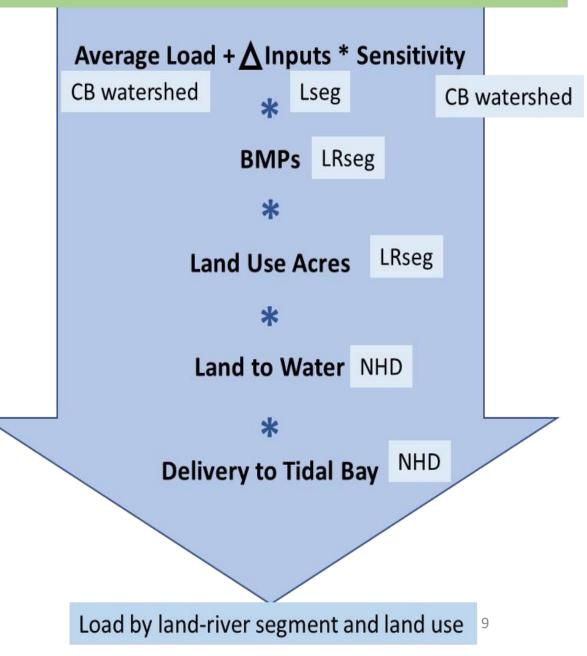

- Non-WQ effects from TMDL actions
- Work falls mostly outside of Modeling team and WQGIT
- Requires coordination with modeling and CAST teams

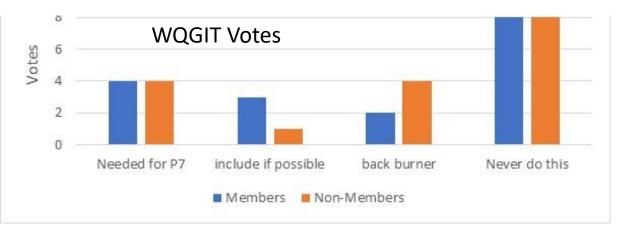

Fine-Scale

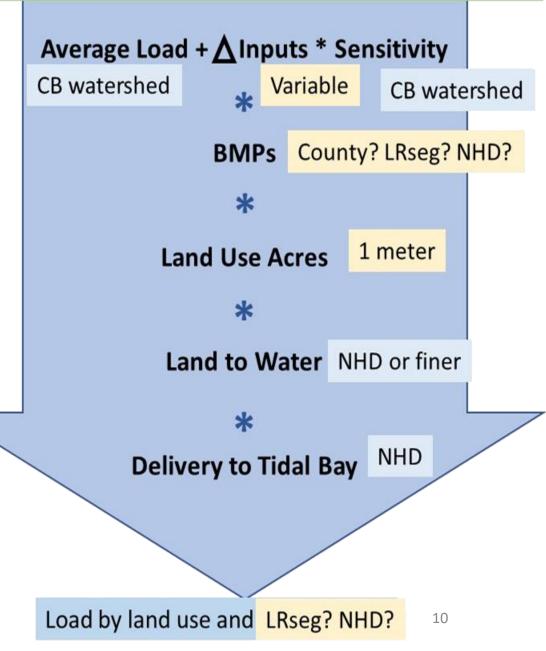

- Few comments
- Half of comments favored use for targeting
- Half opposed
 - Resources better used elsewhere
 - Greater uncertainty at finer scales

Fine-Scale -> Multi-Scale

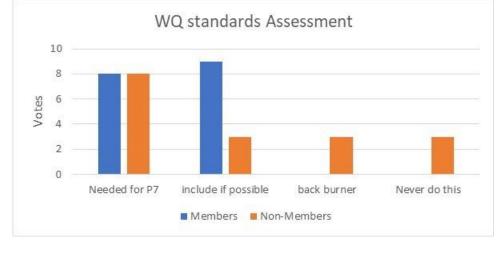

- For the TMDL, what scale for reporting and receiving credit for BMPs based on location?
 - Do you support the opportunity for receiving results at a finer scale that approximate the official results?
- What scale will you use for optimization?
 - How long will you wait for an optimization run?
- What scale of output do we need for the estuarine model? (CBPO recommendation NHD)

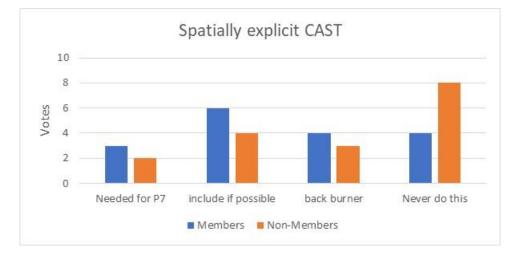

Other priorities

Need to get all standards assessed

• Mixed reaction to fine-scale output

• Support for

- BMP reporting transparency
- High-resolution land use
- Land use change modeling
- New estuarine model

- Many unsolicited comments on
 - CAST usability improvements
 - WQGIT processes
 - Program evaluation
 - BMPs
 - Future planning target calculation methods

Other GITs

CAST use case

CHESAPEAKE

Other GITs, Goals, and Outcomes

Organization that can make *Water Quality* change

> Proposed Water Quality Strategy

Strategy 1 – Piggyback

Consideration of your outcome in water quality organizations' decisions

Example: Healthy Watersheds

Make water quality implementors aware of their plans on your outcome

Nitrogen, Phosphorus, Sediment Loss of Healthy Watersheds

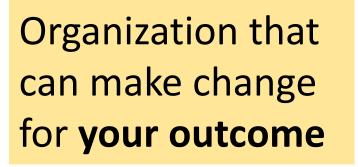

Land Conservation in Healthy Watersheds

Compare to goals

Other GITs, Goals, and Outcomes

Proposed Strategy for **your outcome**

Compare to goals

Phase 6 Watershee

Model/CAS1

Strategy 2 – Mirror Direct use of CAST by implementors of your goal

Example: Habitat GIT

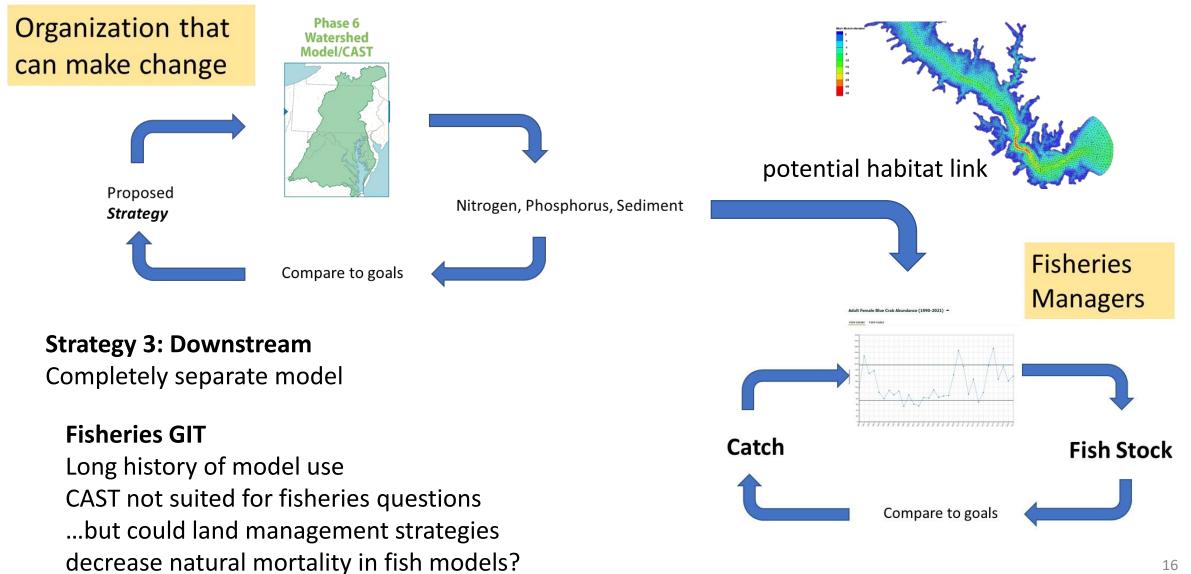

A local government could look at the effects of imperviousness or tree canopy EPA could look at sulfate deposition

BIBI – stream health

Nitrogen, Phosphorus, Sediment

Other GITs, Goals, and Outcomes

STAC review of P6 – recommendations for P7

- Evolve P6
 - Develop a true ensemble model (leave inputs as distributions)
 - More formalized optimization techniques
- Further refine the BMP expert panel approach
- Develop higher spatial resolution models to inform management
- Develop improved modeling strategies for key processes that are not adequately quantifiable based on available scientific knowledge (particularly sediment)

Paraphrased

STAC Modeling Beyond 2025 Workshop - N

- Better quantify nitrogen sources, sinks, and BMPs by exploiting available high-resolution data and by process modeling.
- Develop a true ensemble model (leave inputs as distributions)
- More formal modular and hierarchical modeling system.
- Develop an ensemble of dynamic watershed models.

STAC Modeling Beyond 2025 Workshop - P

- Speciation
- Pay attention to river processes
- Identify critical source areas to target limited restoration resources more efficiently.
- Better account for land use change effects on P exports to capture legacy effects.
- Use more local phosphorus monitoring data for calibration.

STAC Modeling Beyond 2025 Workshop - Sed

- Establish a sediment modeling work group
- Implement short-term improvements.
 - evaluate upland sediment sources
 - improvement of estimates of sediment delivery
 - lowland sediment production and storage
- Long-term improvements
 - New research
 - New conceptual models
 - New numerical models

2019 Regional Hydrologic Model Meeting

- Aligning with living resource modelers and water supply partners
- Outputs
 - Flow, Temperature, Oxygen, Sediment
 - Hourly simulation
 - NHD100k scale
- Benefits to CBP
 - Reservoir operations
 - Withdrawal data
 - Dynamic simulation

Phase 6 Dynamic Watershed Model and CAST-17 documentation

The documentation is for the dynamic and time-averaged Watershed Model. CAST is the same as the time-averaged Phase 6 Model. Creating and running scenario an on-line interface to the time-averaged Model. Due to the length of the documentation, it is divided into sections. Click on the links below to read through the difference documentation.

1. Overview 2. Average Loads

- Appendix 2A: Agricultural Loading Rates
- 3. Terrestrial Inputs
- Appendices ABCDG: Terrestrial Inputs Appendix 3E: Swine Characterization Study Final Report
- Appendix 3F: Turkey Litter Nutrients
- Appendix 3H: Atmospheric Deposition

4. Sensitivity

- Appendix 4A: Sensitivity analysis of the HSPF AgChem Model Appendix 4B: Sensitivity analysis for all land uses
- 5. DRAFT Land Use
- **DRAFT** Land Use Appendix
- 6. Best Management Practices Appendix 6A: BMP Expert Panel Protocol Appendix 6B: Order of Load Source Change Credit 7. Land to Water

8. Direct Loads

- 9. Stream to River
- Appendix 9A: Alternate Stream to River Methods Appendix 9B: Excluded Reservoir Catchments
- 10. River to Bay and Temporal Simulation Appendix 10A: Ftables and Stations Appendix 10B: Calibration Stations Appendix 10C: Nutrients and Sediment Calibration Targets Appendix 10D: HSPF River Water Quality Parameters Appendix 10E: Estuarine Model Linkage
