

# Identifying Sediment Source

ITAT

Sept 10, 2018

Allen Gellis  
USGS Maryland WSC  
[agellis@usgs.gov](mailto:agellis@usgs.gov)

# Maryland's Final 2016 Integrated Report of Surface Water Quality

Figure 1: Stream miles impaired by various pollutants. Colors denote the stream miles currently addressed by TMDLs (blue) and those that still require TMDLs (red).

## Where is all that sediment coming from?

# Sediment Sources

**Energy  
development,  
mining**

**Streambanks**

**Agriculture**

**Urban**

**Construction  
activities**

**Dirt roads**

# Tools to identify sediment sources

- Models – HSPF, GWLF, SWAT, SWMM, SPARROW, etc.
- Field measurements and Assessments
- GIS and Photogrammetry
- Sediment Fingerprinting

**PROBLEM:** Most of the models cannot estimate streambank erosion or target reaches where management actions should be directed.

# SEDIMENT SOURCING USING SEDIMENT FINGERPRINTS

Underlying principle: potential sediment sources can be characterized using a selected suite of diagnostic physical and chemical properties – the fingerprints

Comparison of these fingerprints with equivalent information for fluvial (target) samples permits the relative importance of the potential sources

# Sediment Fingerprinting <0.063 mm

# Sediment Fingerprinting <0.063 mm

# Steps in Sediment Fingerprinting

## Fines (Silts & Clays) ( $<0.063$ mm)

- 1) Identify sources
- 2) Sample sources
- 3) Sample Target—  
(fluvial sediment)
- 4) Lab Prep
- 5) Determine the  
proportion coming  
from each source

# Fluvial or Target Samples

- Suspended sediment – ISCO, Passive Samplers (Walling Tubes), Isokinetic samplers, centrifuge
- Bed material – fine grained sediment deposits  
Recently deposited floodplain sediment –
- Lake/reservoir/pond/impoundment

Passive Sampler (after Phillips, et al., 2000)

# TRACERS OR FINGERPRINTS USED

1. Elemental analysis ICP-MS, OES

2. Radionuclides  $^{137}\text{Cs}$ ,  $^{10}\text{Be}$

3. Stable Isotopes,  $\delta^{13}\text{C}$ ,  $\delta^{15}\text{N}$

4. Mineralogy

5. Magnetic properties

6. Color

SOURCES

The diagram features a yellow jagged shape on the left labeled 'SOURCES' and a blue jagged shape on the right labeled 'TARGET'. Between them is a vertical list of six tracers or fingerprints, each in a black box. The boxes are connected to the yellow shape by thin yellow lines, suggesting a flow of information from the sources to the tracers.

TARGET

# Statistical Steps in Sediment Fingerprinting

Imputing non-detects

Outlier removal

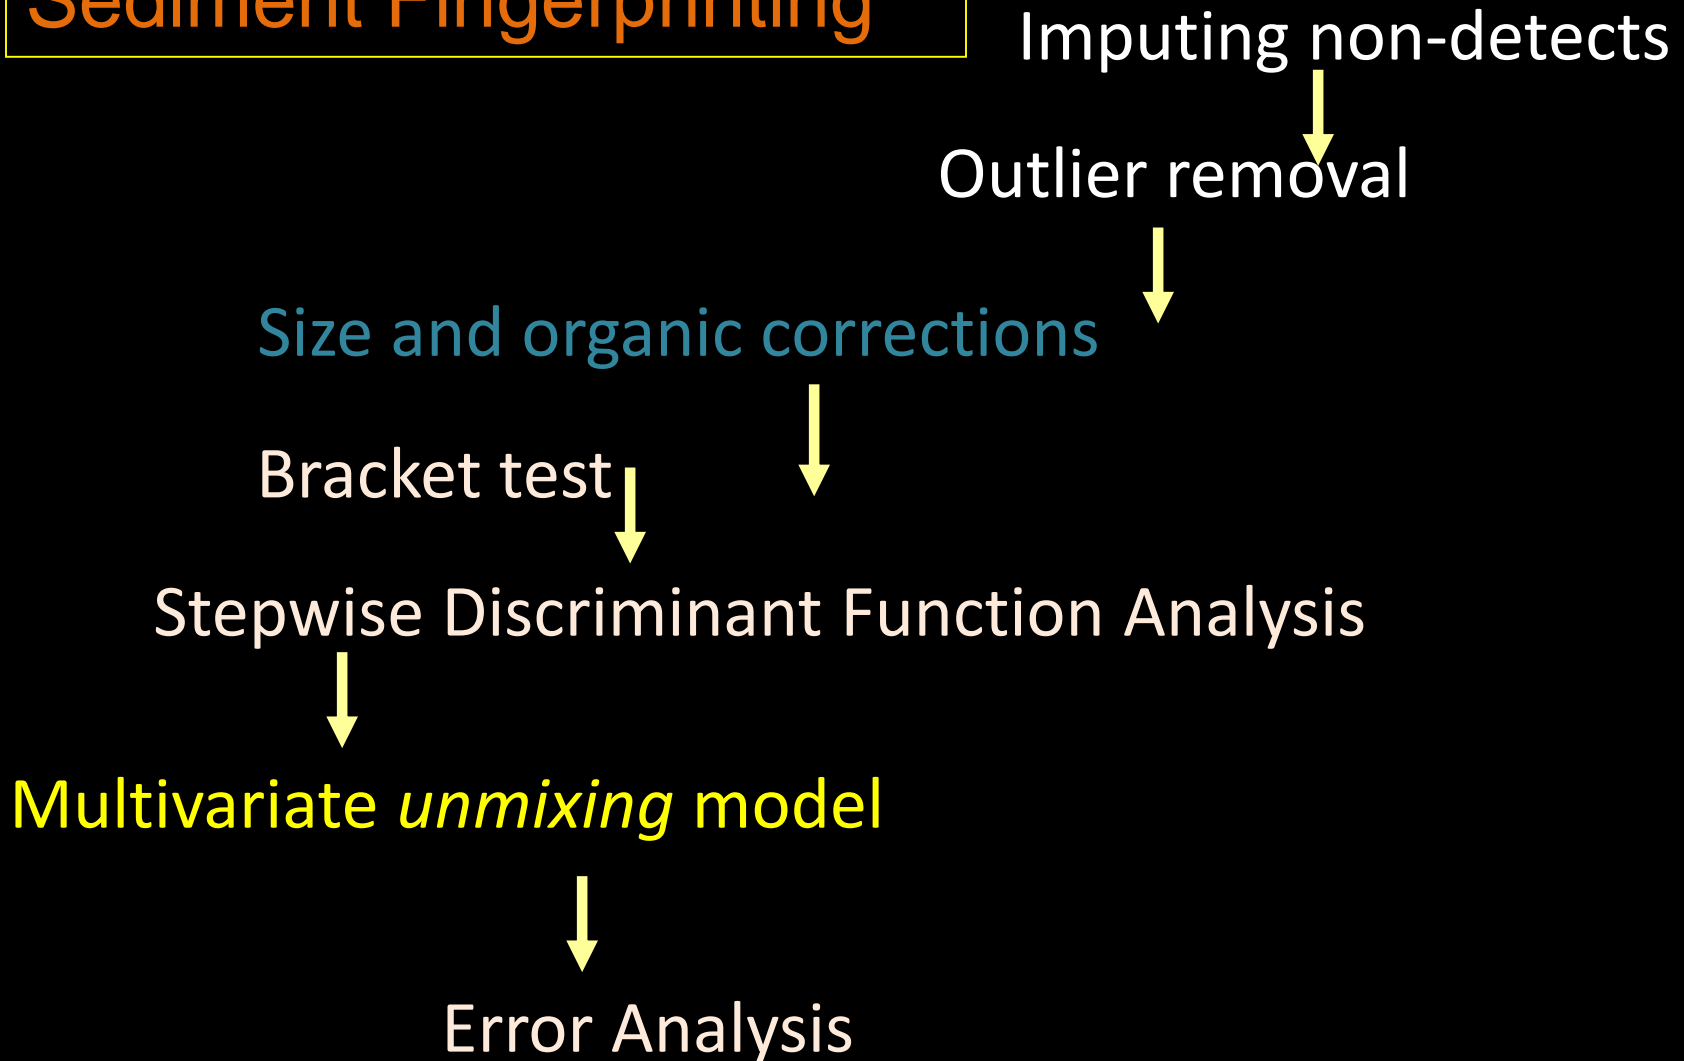

Size and organic corrections

Bracket test

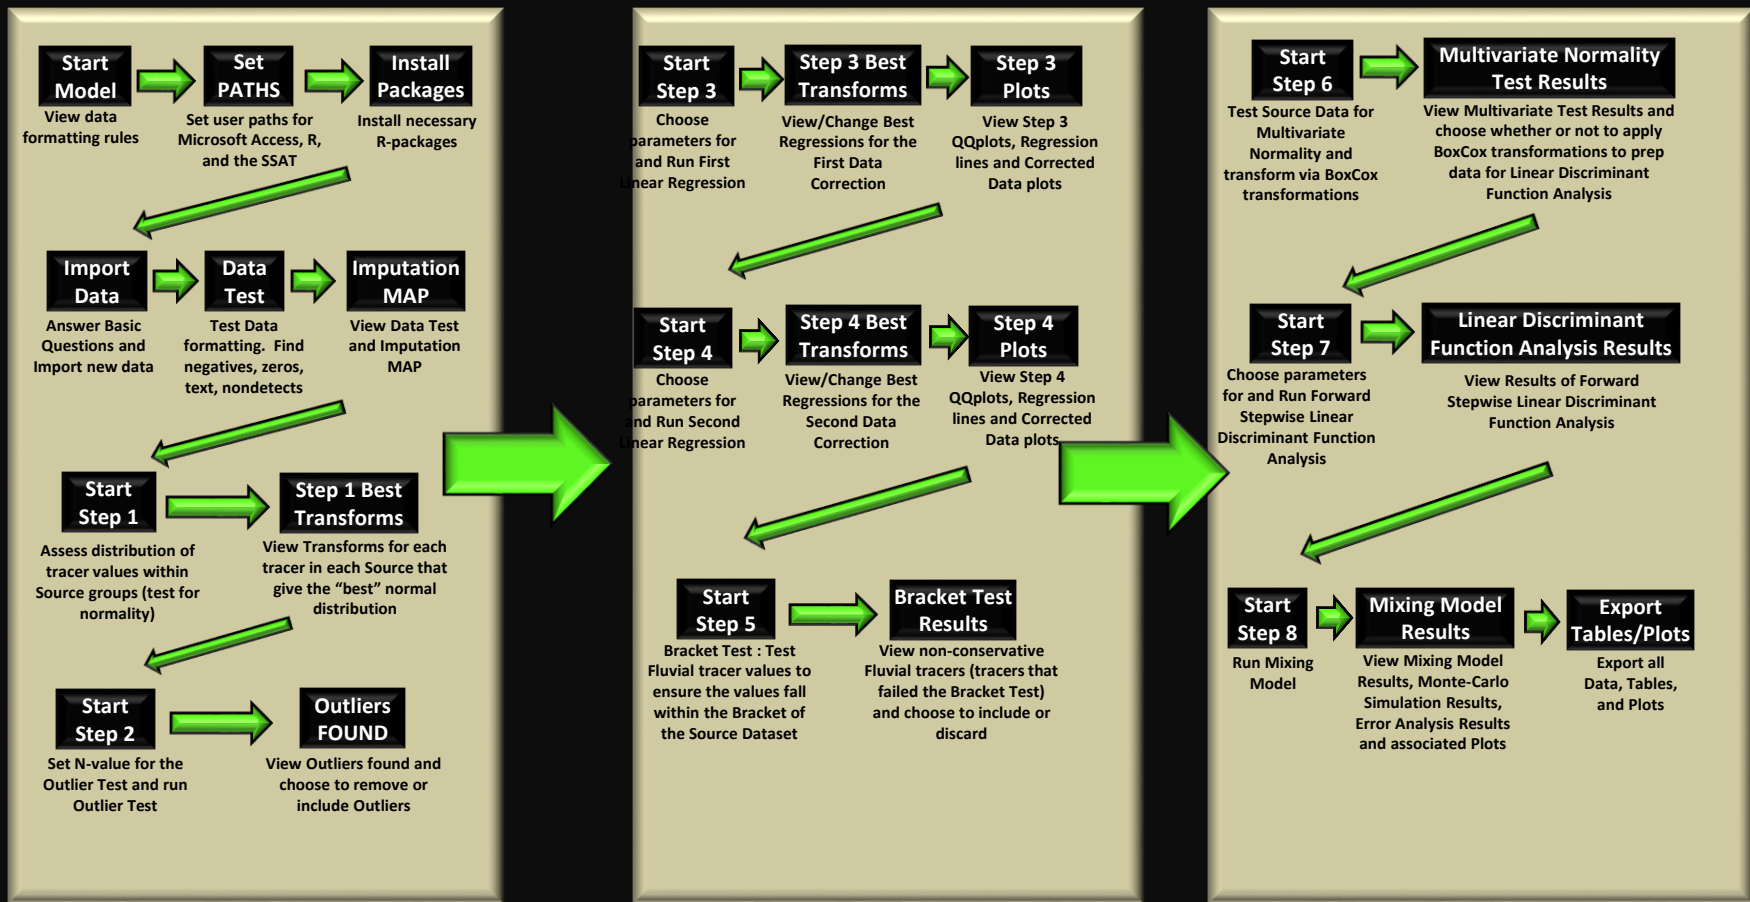

Stepwise Discriminant Function Analysis

Multivariate *unmixing* model

Error Analysis

# SCALE

## Modeling – Chesapeake Bay – major watershed

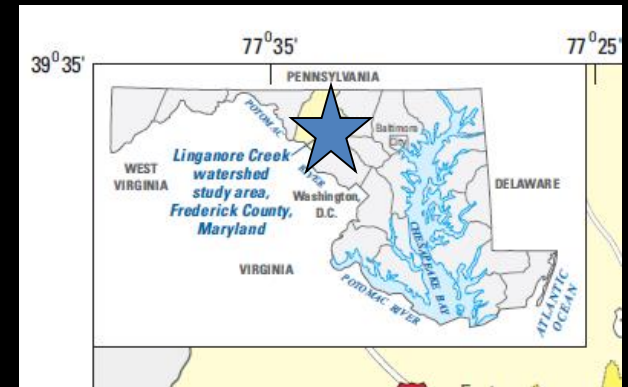

At the  
management scale  
( $<250\text{km}^2$ ) its  
important to  
differentiate  
upland vs channel  
sources

---effective scale  
for monitoring the  
effect of  
management  
actions to reduce  
sediment

# CASE SEDIMENT FINGERPRINTING STUDIES

Linganore Creek 2008-2010 (147 km<sup>2</sup>)  
Piedmont – schist, gneiss  
27% forest  
54 agriculture (pasture and cropland)  
11 % other

# Fingerprinting Results Linganore Creek

Collected 200 fluvial samples  
over 36 storms, 2008-2010

Gellis et al., 2015

final set of tracers used

Al, C,  $\delta^{13}\text{C}$ , Cu, Fe, Li, Mg, Mn, N, Ni, Pb P, V

Weighted  
Results

Banks = 52%

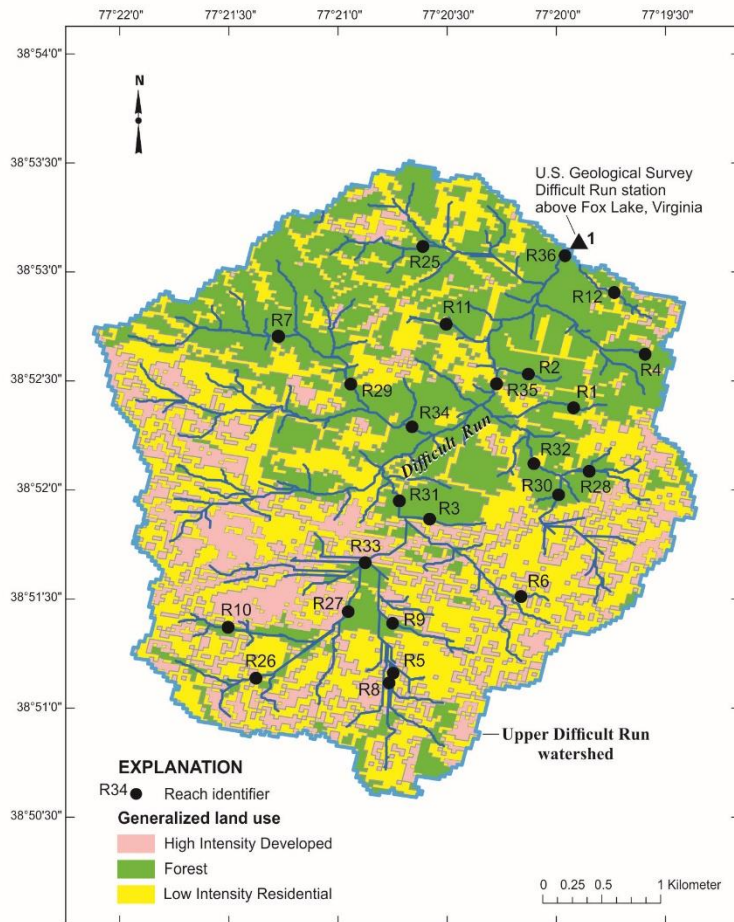

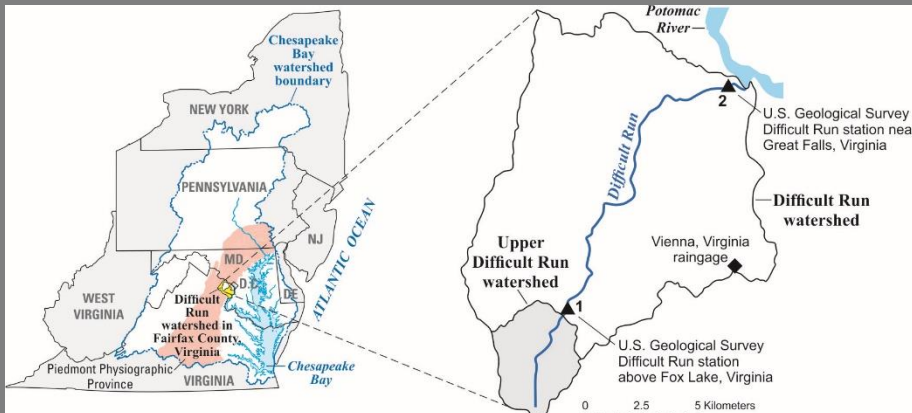

Ag = 45%

Forest = 3%

# Sediment Fingerprinting Results Difficult Run, VA 2008- 2009 (14.2 km<sup>2</sup>)

Bank erosion is a major source of sediment in urban areas – example from Difficult Run, Fairfax County, VA.

Difficult Run, VA above Miller Heights

Total sediment contributed by banks

# SOURCES

FOREST

PASTURE

CROPLAND

BANKS

Smith Creek, Virginia 246 km<sup>2</sup>

## Landuse Classes

	Basin Boundary	

# Smith Creek Results 2012-2015

- Fingerprinting Source Results Compared to Sediment TMDL

Smith Creek TMDL, annual loadings 10,680 Mg/ yr  
(VADEQ, 2009)

Smith Creek TMDL, annual loadings 10,680 Mg/yr (VADEQ, 2009)  
**USGS load 6,260 Mg/yr** (Hyer et al., 2016)

**TMDL Proposed**  
**A 22% reduction**

**Fingerprinting**

Smith Creek Watershed  
TMDL Implementation Plan;  
Rockingham and Shenandoah Counties,  
City of Harrisonburg, and Town of New  
Market, Virginia

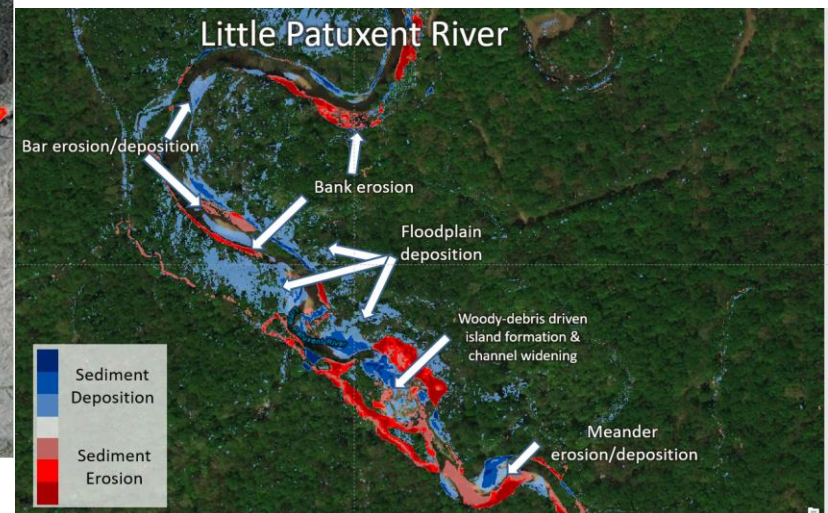

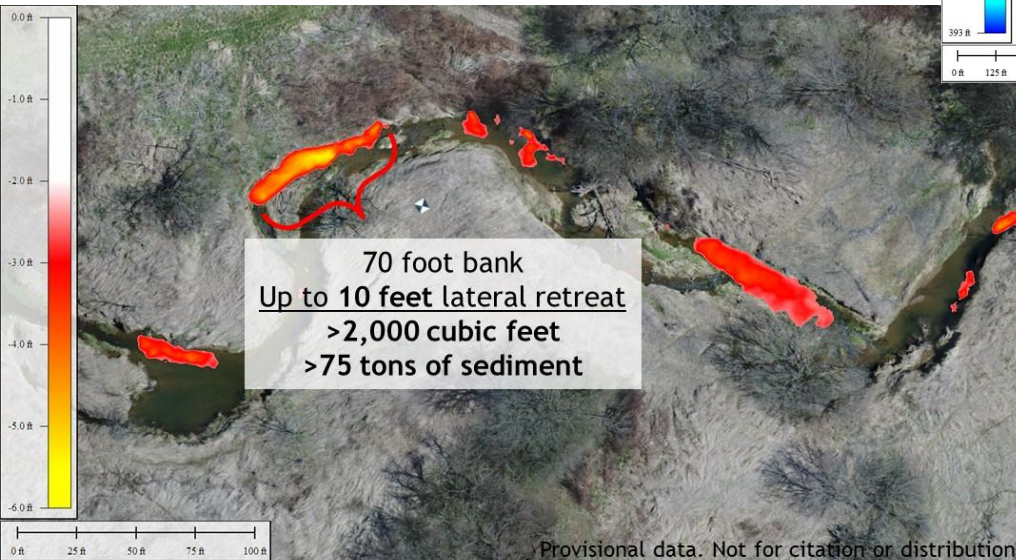

**TMDL**  
**Existing**  
**loadings**

**WHAT**  
**SOURCE IS**  
**MISSING?**

# The next generation of tools for targeting and monitoring

- Lidar, drones, Structure from Motion

# Summary

---

- **Sediment fingerprinting to allocate sources (Sed\_SAT)**
  - Channel vs uplands
  - Allocating Sources at Management Scales
  - Combined with 'state-of-the art' technologies – target sources and monitor the effectiveness of management actions in reducing sediment
  - Education- training for Sediment Fingerprinting and “State-of-the Art” technologies
